

ABSTRACT

A slurry capture system and kit, and methods of using them, are disclosed for facilitating the recovery of a concrete residue, such as from a chute of a cement mixer truck. The system includes a collector for attaching to the chute of the cement mixer truck and for collecting the concrete residue therefrom. The system further includes a container for storing the collected residue and a conduit in fluid communication between the collector and the container for transferring the residue collected in the collector to the container for subsequent disposal.
